## THROMBIN RECEPTOR ANTAGONISTS

### BACKGROUND OF THE INVENTION

The present invention relates to substituted tricyclic thrombin  
10 receptor antagonists, pharmaceutical compositions containing them and  
their use in the treatment of diseases associated with thrombosis,  
atherosclerosis, restenosis, hypertension, angina pectoris, arrhythmia,  
heart failure, cerebral ischemia and cancer.

Thrombin is known to have a variety of activities in different cell  
15 types and thrombin receptors are known to be present in such cell types  
as human platelets, vascular smooth muscle cells, endothelial cells and  
fibroblasts. It is therefore expected that thrombin receptor antagonists  
will be useful in the treatment of thrombotic, inflammatory,  
atherosclerotic and fibroproliferative disorders, as well as other  
20 disorders in which thrombin and its receptor play a pathological role.

Thrombin receptor antagonists peptides have been identified  
based on structure-activity studies involving substitutions of amino  
acids on thrombin receptors. In Bernatowicz et al, *J. Med. Chem.*, 39  
(1996), p. 4879-4887, tetra- and pentapeptides are disclosed as being  
25 potent thrombin receptor antagonists, for example N-trans-cinnamoyl-p-  
fluoroPhe-p-guanidinoPhe-Leu-Arg-NH<sub>2</sub> and N-trans-cinnamoyl-p-  
fluoroPhe-p-guanidinoPhe-Leu-Arg-Arg-NH<sub>2</sub>. Peptide thrombin  
receptor antagonists are also disclosed in WO 94/03479, published  
February 17, 1994.

30 Himbacine, a piperidine alkaloid of the formula

has been identified as a muscarinic receptor antagonist. The total synthesis of (+)-himbacine is disclosed in Chackalamannil et al, J. Am. Chem. Soc., **118** (1996), p. 9812-9813.

#### DETAILED DESCRIPTION:

Unless otherwise defined, the term "alkyl" or "lower alkyl" means straight or branched alkyl chains of 1 to 6 carbon atoms and "alkoxy" similarly refers to alkoxy groups having 1 to 6 carbon atoms.

35 Fluoroalkyl, difluoroalkyl and trifluoroalkyl mean alkyl chains wherein the terminal carbon is substituted by 1, 2 or 3 fluoroatoms, e.g.,

-CF<sub>3</sub>, -CH<sub>2</sub>CF<sub>3</sub>, -CH<sub>2</sub>CHF<sub>2</sub> or -CH<sub>2</sub>CH<sub>2</sub>F. Haloalkyl means an alkyl chain substituted by 1 to 3 halo atoms.

"Alkenyl" means straight or branched carbon chains of 1 to 6 carbon atoms having one or more double bonds in the chain, conjugated or unconjugated. Similarly, "alkynyl" means straight or branched carbon chains of 1 to 6 carbon atoms having one or more triple bonds in the chain. Where an alkyl, alkenyl or alkynyl chain joins two other variables and is therefore bivalent, the terms alkylene, alkenylene and alkynylene are used.

10 "Cycloalkyl" means a saturated carbon ring of 3 to 6 carbon atoms, while "cycloalkylene" refers to a corresponding bivalent ring, wherein the points of attachment to other groups include all positional and stereoisomers.

"Heterocycloalkyl" as a substituent on Het means saturated rings of 4 to 7 atoms comprised of 3 to 4 carbon atoms and 1 to 3 heteroatoms selected from the group consisting of -O-, -S- and -NR<sup>7</sup>- joined to the rest of the molecule through a carbon atom. Examples of heterocycloalkyl groups are 2-azetidiny, 2-pyrrolidinyl, tetrahydrothiophen-2-yl, tetrahydro-2-furanyl, 4-piperidinyl, 2-piperazinyl, tetrahydro-4-pyranyl, 2-morpholinyl and 2-thiomorpholinyl.

"Halogen" refers to fluorine, chlorine, bromine or iodine radicals.

When R<sup>4</sup> and R<sup>5</sup> join to form a ring with the nitrogen to which they are attached, the rings formed are 1-pyrrolidinyl, 1-piperidinyl and 1-piperazinyl, wherein the piperazinyl ring may also be substituted at the 4-position nitrogen by a group R<sup>7</sup>.

"Dihydroxy(C<sub>1</sub>-C<sub>6</sub>)alkyl" refers to an alkyl chain substituted by two hydroxy groups on two different carbon atoms.

"Aryl" means phenyl, naphthyl, indenyl, tetrahydronaphthyl or indanyl.

30 "Heteroaryl" means a single ring, bicyclic or benzofused heteroaromatic group of 5 to 10 atoms comprised of 2 to 9 carbon atoms and 1 to 4 heteroatoms independently selected from the group consisting of N, O and S, provided that the rings do not include adjacent oxygen and/or sulfur atoms. N-oxides of the ring nitrogens are also included, as well as compounds wherein a ring nitrogen is substituted by a C<sub>1</sub>-C<sub>4</sub> alkyl group to form a quaternary amine. Examples of single-

ring heteroaryl groups are pyridyl, oxazolyl, isoxazolyl, oxadiazolyl, furanyl, pyrrolyl, thienyl, imidazolyl, pyrazolyl, tetrazolyl, thiazolyl, isothiazolyl, thiadiazolyl, pyrazinyl, pyrimidyl, pyridazinyl and triazolyl. Examples of bicyclic heteroaryl groups are naphthyridyl (e.g., 1, 5 or 1,7), imidazopyridyl, pyrido[2,3]imidazolyl, pyridopyrimidinyl and 7-azaindolyl. Examples of benzofused heteroaryl groups are indolyl, quinolyl, isoquinolyl, phthalazinyl, benzothienyl (i.e., thionaphthenyl), benzimidazolyl, benzofuranyl, benzoxazolyl and benzofurazanyl. All positional isomers are contemplated, e.g., 1-pyridyl, 2-pyridyl, 3-pyridyl and 4-pyridyl. W-substituted heteroaryl refers to such groups wherein substitutable ring carbon atoms have a substituent as defined above, or where adjacent carbon atoms form a ring with an alkylene group or a methylenedioxy group.

The term "Het" is exemplified by the single ring, bicyclic and benzofused heteroaryl groups as defined immediately above, as well as tricyclic groups such as benzoquinolinyl (e.g., 1,4 or 7,8) or phenanthrolinyl (e.g., 1,7; 1,10; or 4,7). Het groups are joined to group B by a carbon ring member, e.g., Het is 2-pyridyl, 3-pyridyl or 2-quinolyl.

Examples of heteroaryl groups wherein adjacent carbon atoms form a ring with an alkylene group are 2,3-cyclopentenopyridine, 2,3-cyclohexenopyridine and 2,3-cycloheptenopyridine.

The term "optional double bond" refers to the bond shown by the single dotted line in the middle ring of the structure shown for formula I. The term "optional single bond" refers to the bond shown by the double dotted line between X and the carbon to which Y and R<sup>15</sup> are attached in the structure of formula I. Compounds wherein the bond is absent are shown, for example, in Example 6.

The above statements, wherein, for example, R<sup>4</sup> and R<sup>5</sup> are said to be independently selected from a group of substituents, means that R<sup>4</sup> and R<sup>5</sup> are independently selected, but also that where an R<sup>4</sup> or R<sup>5</sup> variable occurs more than once in a molecule, those occurrences are independently selected. Those skilled in the art will recognize that the size and nature of the substituent(s) will affect the number of substituents which can be present.

Compounds of the invention have at least one asymmetrical carbon atom and therefore all isomers, including diastereomers and

5

is a saturated ring have the following stereochemistry:

- Commercially available (*R*)-3-butyn-2-ol is *O*-protected as the tetrahydropyranyl ether by treatment with dihydropyran in the presence of catalytic amounts of para-toluenesulfonic acid to give intermediate
- 5 **1a**. Treatment of a solution of **1a** in THF with *n*-BuLi at -78°C followed by quenching with benzylchloroformate and subsequent deprotection gives intermediate **2** which is esterified with dienoic acid **3** using standard conditions to yield the ester **4**. Selective reduction of the triple bond of **4** using Lindlar catalyst under hydrogen gives the intermediate
- 10 **5**, which upon thermal cyclization between 200-210°C followed by base treatment gives the tricyclic intermediate **6**. The ester **6** is subjected to hydrogenation in the presence of platinum oxide to generate the intermediate saturated carboxylic acid, treatment of which with SOCl<sub>2</sub> gives the corresponding acid chloride which is converted to the tricyclic
- 15 aldehyde **7** by reduction using tributyltin hydride in the presence of Pd(0). Condensation of the anion generated from phosphonate **8** with aldehyde **7** in THF gives the alkene **9** (final product).

- Intermediates of formula **8** wherein W is aryl or R<sup>21</sup>-aryl can be prepared by a process similar to that described immediately below for preparing the trifluoromethyl-phenyl-substituted compound, **8a**.
- 20

- Commercially available hydroxypyridine derivative is converted to the corresponding triflate using triflic anhydride, which is then coupled with commercially available boronic acid in the presence of Pd(0) under
- 25 Suzuki conditions. The resulting product is converted to the

phosphonate by treatment with tert-butyllithium followed by quenching with diethylchlorophosphonate.

Alternatively, compounds of formula 9 wherein W is optionally substituted aryl can be prepared from compounds of formula 9 wherein W is -OH using a triflate intermediate. For example, 3-hydroxy-6-methylpyridine is treated with triisopropylsilyl chloride, and the resultant hydroxy-protected compound is converted to the phosphonate as described above for preparing intermediate 8. The triisopropylsilyl-protected intermediate is then reacted with tricyclic intermediate 7 and the protecting group is removed under standard conditions. The resultant compound of formula 9 wherein W is OH is then treated with triflic anhydride at room temperature in a solvent such as CH<sub>2</sub>Cl<sub>2</sub>; the triflate is then reacted with an optionally substituted arylboronic acid, e.g., optionally substituted phenylboronic acid, in a solvent such as toluene, in the presence of Pd(PPh<sub>3</sub>)<sub>4</sub> and a base such as K<sub>2</sub>CO<sub>3</sub> at elevated temperatures and under an inert atmosphere.

Compounds of formula 9 wherein W is a substituted hydroxy group (e.g., benzyloxy) can be prepared from compounds of formula 9 wherein W is hydroxy by refluxing in a suitable solvent such as acetone with a halogen-substituted compound such as optionally substituted benzyl bromide in the presence of a base such as K<sub>2</sub>CO<sub>3</sub>.

Compounds of formula I wherein Het is substituted by W through a carbon atom (e.g., wherein W is alkyl, alkenyl or arylalkyl) or a nitrogen atom (i.e., -NR<sup>4</sup>R<sup>5</sup>) can be prepared using a compound of formula I wherein W is chloroalkyl as an intermediate. Compounds of formula I wherein W is a polar group such as hydroxy alkyl, dihydroxyalkyl, -COOH, dimethylamino and -COH can be prepared as shown in Scheme 1B, wherein the starting material is a compound of formula I wherein W is alkenyl. The following Schemes 1A and 1B show well-known reaction conditions for preparing various W-substituted compounds wherein Q is cyclohexyl, X is -O-, Y is =O, R<sup>15</sup> is absent, R<sup>1</sup> is methyl, R<sup>2</sup>, R<sup>3</sup>, R<sup>9</sup>, R<sup>10</sup> and R<sup>11</sup> are each H, B is -CH=CH-, and Het is 2-pyridyl.

The resultant compounds wherein Y is (H, OH) can be converted to the corresponding compounds wherein Y is (H, alkoxy) by reacting the hydroxy compound with an appropriate alkanol in the presence of a reagent such as BF<sub>3</sub>•OEt<sub>2</sub>. A compound wherein Y is (H, OH) can also be converted to  
20   the corresponding compound wherein Y is (H, H) by treating the hydroxy compound with BF<sub>3</sub>•OEt<sub>2</sub> and Et<sub>3</sub>SiH in an inert solvent such as CH<sub>2</sub>Cl<sub>2</sub> at low temperatures.

- Compounds of formula I wherein R<sup>9</sup> is hydrogen can be converted to the corresponding compound wherein R<sup>9</sup> is hydroxy by  
25   heating with an oxidizing agent such as SeO<sub>2</sub>.

- In Scheme 2, a process is shown for preparing compounds of formula I wherein n is 0, the optional double bond is present, Q forms a cyclohexyl ring, X is -O-, Y is =O, R<sup>2</sup>, R<sup>3</sup>, R<sup>8</sup>, R<sup>9</sup> and R<sup>11</sup> are each hydrogen, R<sup>1</sup> is methyl, R<sup>10</sup> is absent, B is -CH=CH-, and Het is W-substituted pyridyl. However, a similar process may be used to prepare

The alcohol **1** is O-protected as the TBDMS ether by treatment with TBDMS chloride. The anion generated from **1b** is quenched with a solution of iodine to give the corresponding acetylenic iodide, which upon reduction using di(cyclohexyl)borane gives the cis-vinyl iodide **10**. Coupling of vinyl iodide **10** with trimethylsilylacetylene in the presence of Cu(I) and Pd(0) gives the intermediate **11** after removal of the protecting group using trifluoroacetic acid in CH<sub>3</sub>OH. Esterification of **11** with acid **3** gives the intermediate ester **12**, which upon thermal cyclization at 185-195°C gives the tricyclic precursor **13** after a brief treatment with DBU. Desilylation of acetylenic derivative **13** followed by hydrostannylation using tributyltinhydride in the presence of AIBN gives the vinylstannane derivative **15**, which is coupled with halopyridine derivative **16** to give the final product **17**.

Scheme 2A offers an alternative procedure:

Palladium-mediated coupling of acetylene **1b** with trans-iodovinylpyridine **28** followed by selective reduction of the triple bond gives the intermediate dienoic alcohol **29** which is esterified with the dienoic acid **3** to give **30**. Thermal cyclization of **30** at 190-210°C followed by base treatment gives **17**. Intermediate **28** is prepared from (2-chloro-6-methyl)pyridine by coupling with (trimethylsilyl)acetylene in the presence of palladium, followed by deprotection of the silyl group using fluoride anion and treatment of the isolated product with tributyltin hydride followed by iodine.

In Scheme 3, a process is shown for preparing compounds of formula I wherein *n* is 0, the optional double bond is not present, Q forms a phenyl ring, X is -O-, Y is =O, R<sup>1</sup>, R<sup>2</sup>, R<sup>3</sup>, R<sup>8</sup> and R<sup>9</sup> are each hydrogen, R<sup>10</sup> and R<sup>11</sup> are absent, B is -CH=CH-, and Het is methoxy-substituted quinolyl. Hydrogenation of **22** over platinum oxide gives the carboxylic acid **23** which is converted to the corresponding acid chloride under standard conditions. Reduction of the acid chloride generated from **23** using Pd(0) and tributyltin hydride gives the aldehyde **24** which is condensed with the anion generated from the phosphonate **25** to give the final product, **26**.

Compounds wherein R<sup>3</sup> is alkyl can be prepared from the corresponding compounds wherein R<sup>3</sup> is hydrogen. For example, treatment of compound **26** with LDA followed by CH<sub>3</sub>I results in the preparation of the corresponding compound **27** wherein R<sup>3</sup> is methyl:

However, a similar process may be used to prepare compounds comprising other optionally substituted Het groups.

## EXAMPLE 2

- Step 1:** To a solution of compound **1b** (4.532 g, 24.6 mmol) in THF (15 ml), cooled to 0 °C under argon, was added a solution of *n*-BuLi (1.6 M in cyclohexane, 17 ml, 27 mmol). After stirring at 0 °C for 40 min, a solution of I<sub>2</sub> (6.24 g, 24.6 mmol) in THF (10 ml) was added and the reaction mixture was stirred for an additional 15 min. The reaction was quenched by addition of water (25 ml) and diluted with hexane (50 ml).
- The aqueous phase was extracted with hexane (3 x 50 ml). The combined organic phase was washed with 5% sodium thiosulfate solution (2 x 50 ml), dried over MgSO<sub>4</sub> and evaporated *in vacuo* to give the acetylenic iodide **1c** as an orange oil (7.281 g, 95%).
- [α]<sub>D</sub><sup>23</sup> -48.8 (*c* 1.23, CHCl<sub>3</sub>); IR (CH<sub>2</sub>Cl<sub>2</sub>) 2200 cm<sup>-1</sup>; <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>) δ 0.11 (s, 3 H), 0.12 (s, 3 H), 0.90 (s, 9 H, C(CH<sub>3</sub>)<sub>3</sub>), 1.40 (d, *J*=6.5 Hz, 3 H, CH<sub>3</sub>), 4.63 (q, *J*=6.4 Hz, 1 H, CH(OTBS)); <sup>13</sup>C NMR (100 MHz, CDCl<sub>3</sub>) δ -4.65, -0.31, 18.21, 25.35, 25.76, 60.50, 96.98.

- Step 2:** To a solution of cyclohexene (6.8 ml, 67 mmol) in anhydrous pentane (50 ml) stirred at 0 °C under argon was added borane-methyl sulfide complex (2 M in THF, 16.7 ml, 33.4 mmol). The solution was warmed to room temperature and stirred for 1 h to give a

cloudy suspension to which was added the acetylenic iodide **1c** (8.446 g, 27.2 mmol). The resulting clear solution was stirred at room temperature for 80 min, and glacial acetic acid (5 ml, 87.3 mmol) was added. After stirring the reaction mixture for 20 min, ethanolamine (5.2 ml, 86.2 mmol) was added and stirring was continued for an additional 15 min. The mixture was diluted with EtOAc (300 ml), washed with water (2 x 100 ml), and brine (100 ml). The organic phase was dried over anhydrous MgSO<sub>4</sub> and concentrated *in vacuo* to yield the crude product as a yellow oil. Purification by column chromatography on silica gel (hexane) gave *cis*-vinyl iodide **10** as a colorless oil (7.167 g, 84%).

Step 3: To a solution of PdCl<sub>2</sub>(PhCN)<sub>2</sub> (58.1 mg, 0.15 mmol) and CuI (58.8 mg, 0.31 mmol) in piperidine (3 ml) was added a solution of the *cis*-vinyl iodide **10** (303 mg, 0.97 mmol) in anhydrous THF (3 ml). This was followed by addition of (trimethylsilyl)acetylene (0.35 ml, 2.48 mmol) which was accompanied by a color change from dark green to pale green and then to black over 5 min. The solution was stirred at room temperature under argon for 18 h. The solvents were removed *in vacuo* and the mixture was purified by flash chromatography on silica gel (hexane, followed by 5% EtOAc in hexane) to give the product **11** as a yellow oil (267 mg, 98%).

Step 4: To a solution of the protected enyne **11** (1.744 g, 10.38 mmol) in CH<sub>3</sub>OH (30 ml) was added TFA (0.6 ml). The reaction mixture was stirred at rt for 2 h. The solvent was removed *in vacuo* and the residue was diluted with Et<sub>2</sub>O (40 ml) and water (40 ml). The aqueous

phase was extracted with Et<sub>2</sub>O (3 x 40 ml), the combined organic phase was washed with brine (50 ml), dried over MgSO<sub>4</sub>, and concentrated. The final trace of solvent was removed under high vacuum.

To a solution of the deprotected enyne from above in anhydrous CH<sub>2</sub>Cl<sub>2</sub> (30 ml) was added 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide hydrochloride (4.412 g, 23.01 mmol), dimethylaminopyridine (DMAP) (2.836 g, 23.2 mmol), TEMPO (1 mg), and dienoic acid **3** (2.414 g, 15.9 mmol). The reaction mixture was stirred at room temperature under argon for 18 h. The solvents were removed and the mixture was diluted with EtOAc (300 ml). The organic phase was washed with water (150 ml), 0.5 N HCl solution (2 x 100 ml), and brine (100 ml) and dried over anhydrous MgSO<sub>4</sub>. Evaporation under reduced pressure yielded the ester **12** as a brown oil (2.601 g, 83%). An analytical sample was prepared by further chromatography on silica gel (5% EtOAc in hexane).

## EXAMPLE 3

The compound numbers used in the following steps correspond to those shown in reaction Scheme 3, above.

- 5 Step 1: A solution of THP-ether **18** (2.8 g, 20 mmol) in dry THF (100 ml) was cooled to -78 °C and *n*-BuLi (25 mmol, 10 ml, 2.5N in hexanes) was added dropwise. After 15 min at that temperature, benzyl chloroformate (3.75 ml, 25 mmol, 95% pure) was added dropwise. The resulting solution was stirred at -78 °C for 2 h and the reaction quenched by
- 10 addition of NH<sub>4</sub>Cl (sat. sol). After reaching room temperature, the reaction mixture was diluted with Et<sub>2</sub>O (50 ml) and washed with brine. The organic phase was dried (MgSO<sub>4</sub>) and solvents removed in rotavapor, yielding 7.0 g of crude ester **19**. <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 1.3-2.0 (m, 6H), 3.6-3.9 (m, 2H), 4.45 (s, 2H), 5.27 (s, 2H), 7.40 (m, 5H).
- 15 Step 2: Crude THP-ether **19** (7.0 g) was dissolved in CH<sub>3</sub>OH (15 ml) and a catalytic amount of PTSA (250 mg) added at room temperature. After 15 min, the solution was diluted with Et<sub>2</sub>O and brine, and the organic phase washed with NaHCO<sub>3</sub> (sat. sol.) and brine, and dried (MgSO<sub>4</sub>). Solvents were removed in rotavapor, yielding 4.6 g of crude
- 20 alcohol **20**. <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 4.45 (s, 2H), 5.27 (s, 2H), 7.40 (m, 5H).
- Step 3: Crude alcohol **20** (4.6 g) was dissolved in CH<sub>2</sub>Cl<sub>2</sub> (50 ml) containing DMAP (catalytic amounts) and Et<sub>3</sub>N (3 ml) at 0 °C. Cinnamoyl chloride (3.3 g, 20 mmol) was added and the mixture stirred at 0 °C for 30 min. The resulting suspension was diluted with Et<sub>2</sub>O and
- 25 water, and the organic phase successively washed with NaOH (10%, 50 ml), HCl (2N, 50 ml) and brine, dried (MgSO<sub>4</sub>) and the solvents removed in rotavapor, yielding crude ester **21** (7.2 g). <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 5.0 (s, 2H), 5.27 (s, 2H), 6.50 (d, J = 16 Hz, 1H), 7.40-7.70 (m, 10H), 7.80 (d, J = 16 Hz, 1H).

Step 4: A solution of cinnamic ester **21** (7.2 g) in o-xylene (50 ml) was degassed with Ar and heated at 190 °C in pressure tube for 18 h. The mixture was cooled down, and the solvent removed in rotavapor. After chromatographic purification, lactone **22** (3.0g, 44% yield from ether **18**) was obtained. <sup>1</sup>H NMR (CDCl<sub>3</sub>) δ 3.62 (m, 1H), 3.78 (d, J = 15.2 Hz, 1H), 4.08 (t, J = 8.8 Hz, 1H), 4.68 (t, J = 8.8 Hz, 1H), 5.34 (d, J = 12.0 Hz, 1H), 5.42 (d, J = 12 Hz, 1H), 7.2-7.5 (m, 10H).

Step 5: Lactone **22** (0.9 g) was dissolved in CH<sub>3</sub>OH (40 ml) and hydrogenated under 60 psi of total pressure in the presence of PtO<sub>2</sub> (150 mg) for 14 h. The catalyst was filtered off through a celite bed, and the solvent removed in rotavapor. Acid **23** (270 mg, 41%) crystallizes from EtOAc and hexanes. <sup>1</sup>H-NMR (CDCl<sub>3</sub>) δ 2.93 (dd, 3.2; 15.3 Hz, 1H), 3.52 (dd, J = 7.8; 15.3 Hz, 1H), 3.23 (m, 1H), 3.55 (m, 1H), 3.61 (d, J = 3.2 Hz, 1H), 3.7 (dd, J = 5.5; 9.5 Hz, 1H), 4.44 (t, J = 9.2 Hz, 1H), 7.1-7.2 (m, 4H).

Step 6: Carboxylic acid **23** (0.18 g) was suspended in CH<sub>2</sub>Cl<sub>2</sub> (5 mL) containing (COCl)<sub>2</sub> (0.15 ml) under an N<sub>2</sub> atmosphere at room temperature. A drop of DMF was added and the resulting mixture stirred at room temperature for 1 h. Solvents were removed in rotavapor, and the crude solid obtained was washed twice with toluene, removing the solvent in rotavapor. A white solid results, which was treated with a solution of toluene (5 ml) and tributyltin hydride (0.3 ml) containing catalytic amounts of Pd(PPh<sub>3</sub>)<sub>4</sub> at 0 °C. After 2 h, the mixture was diluted with Et<sub>2</sub>O and the organic phase washed with brine. Chromatographic purification afforded aldehyde **24** (95 mg, 56% yield) as a solid. <sup>1</sup>H-NMR (CDCl<sub>3</sub>) δ 2.75 (ddd, 1.0; 7.1; 15.5 Hz, 1H), 3.52 (dd, J = 2.3; 15.5 Hz, 1H), 3.5 (m, 1H), 3.64 (d, J = 1.8 Hz, 1H), 3.78 (m, 1H), 3.83 (dd, J = 4.7; 9.2 Hz, 1H), 4.55 (t, J = 9.1 Hz, 1H), 7.2-7.4 (m, 4H); 9.56 (s, 1H).

Step 7: A solution of phosphonate **25** (125 mg, 0.45 mmol) in dry THF (10 ml) at 0 °C was treated with *n*-BuLi (0.2 ml, 0.5 mmol, 2.5N in hexanes). After 15 min, a solution of aldehyde **24** (95 mg) in dry THF was added. The resulting solution was stirred at that temperature for 30 min, and diluted with Et<sub>2</sub>O and brine. The organic phase was washed with brine and dried (MgSO<sub>4</sub>). Solvents are removed in rotavapor, and chromatographic purification affords the title compound (50 mg, 32%).

In Vitro Testing Procedure for Thrombin Receptor Antagonists:Preparation of [<sup>3</sup>H]haTRAP

A(pF-F)R(ChA)(hR)(I<sub>2</sub>-Y)-NH<sub>2</sub> (1.03 mg) and 10% Pd/C (5.07 mg) were suspended in DMF (250 µl) and diisopropylethylamine (10 µl).

The collected DMF solution of the crude peptide was diluted with water and freeze dried to remove the labile tritium. The solid peptide was redissolved in water and the freeze drying process repeated. The tritiated peptide ([<sup>3</sup>H]haTRAP) was dissolved in 0.5 ml of 0.1% aqueous TFA and purified by HPLC using the following conditions:
- 10 column, Vydac C18, 25 cm x 9.4 mm I.D.; mobile phase, (A) 0.1% TFA in water, (B) 0.1% TFA in CH<sub>3</sub>CN; gradient, (A/B) from 100/0 to 40/60 over 30 min; flow rate, 5 ml /min; detection, UV at 215 nm. The radiochemical purity of [<sup>3</sup>H]haTRAP was 99% as analyzed by HPLC. A batch of 14.9 mCi at a specific activity of 18.4 Ci/mmol was obtained.

20 Preparation of platelet membranes

- Platelet membranes were prepared using a modification of the method of Natarajan et al (Natarajan et al, Int. J. Peptide Protein Res. 45:145-151 (1995)) from 20 units of platelet concentrates obtained from the North Jersey Blood Center (East Orange, NJ) within 48 hours of collection. All steps were carried out at 4° C under approved biohazard safety conditions. Platelets were centrifuged at 100 x g for 20 minutes at 4° C to remove red cells. The supernatants were decanted and centrifuged at 3000 x g for 15 minutes to pellet platelets. Platelets were resuspended in 10 mM Tris-HCl, pH 7.5, 150 mM NaCl, 5 mM EDTA, to
- 25 a total volume of 200 ml and centrifuged at 4400 x g for 10 minutes. This step was repeated two additional times. Platelets were resuspended in 5 mM Tris-HCl, pH 7.5, 5 mM EDTA to a final volume of approximately 30 ml and were homogenized with 20 strokes in a Dounce homogenizer. Membranes were pelleted at 41,000 x g, resuspended in 40-50 ml 20
- 30 mM Tris-HCl, pH 7.5, 1 mM EDTA, 0.1 mM dithiothreitol, and 10 ml aliquots were frozen in liquid N<sub>2</sub> and stored at -80° C. To complete

membrane preparation, aliquots were thawed, pooled, and homogenized with 5 strokes of a Dounce homogenizer. Membranes were pelleted and washed 3 times in 10 mM triethanolamine-HCl, pH 7.4, 5 mM EDTA, and resuspended in 20-25 ml 50 mM Tris-HCl, pH 7.5, 10 mM MgCl<sub>2</sub>, 1 mM EGTA, and 1% DMSO. Aliquots of membranes were frozen in liquid N<sub>2</sub> and stored at -80° C. Membranes were stable for at least 3 months. 20 units of platelet concentrates typically yielded 250 mg of membrane protein. Protein concentration was determined by a Lowry assay (Lowry et al, J. Biol. Chem., 193:265-275 (1951)).

10 High Throughput Thrombin Receptor Radioligand Binding Assay

Thrombin receptor antagonists were screened using a modification of the thrombin receptor radioligand binding assay of Ahn et al. (Ahn et al, Mol. Pharmacol., 51:350-356 (1997)). The assay was performed in 96 well Nunc plates (Cat. No. 269620) at a final assay volume of 200 µl. Platelet membranes and [<sup>3</sup>H]haTRAP were diluted to 0.4 mg/ml and 22.2 nM, respectively, in binding buffer (50 mM Tris-HCl, pH 7.5, 10 mM MgCl<sub>2</sub>, 1 mM EGTA, 0.1% BSA). Stock solutions (10 mM in 100% DMSO) of test compounds were further diluted in 100% DMSO. Unless otherwise indicated, 10 µl of diluted compound solutions and 90 µl of radioligand (a final concentration of 10 nM in 5% DMSO) were added to each well, and the reaction was started by the addition of 100 µl of membranes (40 µg protein/well). The binding was not significantly inhibited by 5% DMSO. Compounds were tested at three concentrations (0.1, 1 and 10 µM). The plates were covered and vortex-mixed gently on a Lab-Line Titer Plate Shaker for 1 hour at room temperature. Packard UniFilter GF/C filter plates were soaked for at least 1 hour in 0.1% polyethyleneimine. The incubated membranes were harvested using a Packard FilterMate Universal Harvester and were rapidly washed four times with 300 µl ice cold 50 mM Tris-HCl, pH 7.5, 10 mM MgCl<sub>2</sub>, 1 mM EGTA. MicroScint 20 scintillation cocktail (25 µl) was added to each well, and the plates were counted in a Packard TopCount Microplate Scintillation Counter. The specific binding was defined as the total binding minus the nonspecific binding observed in the presence of excess (50 µM) unlabeled haTRAP. The % inhibition by a compound of [<sup>3</sup>H]haTRAP binding to thrombin receptors was calculated from the following relationship:

-121-

% Inhibition =

$$\frac{\text{Total binding} - \text{Binding in the presence of a test compound}}{\text{Total binding} - \text{Nonspecific binding}} \times 100$$

### Materials

5                    A(pF-F)R(ChA)(hR)Y-NH<sub>2</sub> and A(pF-F)R(ChA)(hR)(I<sub>2</sub>-Y)-NH<sub>2</sub>, were custom synthesized by AnaSpec Inc. (San Jose, CA). The purity of these peptides was >95%. Tritium gas (97%) was purchased from EG&G Mound, Miamisburg Ohio. The gas was subsequently loaded and stored on an IN/US Systems Inc. Trisorber. MicroScint 20  
10                    scintillation cocktail was obtained from Packard Instrument Co.

### Protocol For Ex-Vivo Platelet Aggregation In Cynomolgus Whole Blood Drug administration and blood collection:

                    Conscious chaired cynomolgus monkeys are allowed to equilibrate for 30 min. A needle catheter is inserted into a brachial vein  
15                    for infusion of test drugs. Another needle catheter is inserted into the other brachial or saphenous vein and used for blood sampling. In those experiments where the compound is administered orally only one catheter is used. A baseline blood sample (1-2 ml) is collected in vacutainer tubes containing a thrombin inhibitor CVS 2139 (100 µg/0.1  
20                    ml saline) as an anticoagulant. The drug is then infused intravenously over a period of 30 min. Blood samples (1 ml) are collected at 5, 10, 20, 30 min during and 30, 60, 90 min after termination of the drug infusion. In PO experiments the animals are dosed with the drug using a gavage cannula. Blood samples are collected at 0, 30, 60, 90, 120, 180, 240,  
25                    300, 360 min after dosing. 0.5 ml of the blood is used for whole blood aggregation and the other 0.5 ml is used for determining the plasma concentration of the drug or its metabolites. Aggregation is performed immediately after collection of the blood sample as described below.

### Whole Blood Aggregation:

30                    A 0.5 ml blood sample is added to 0.5 ml of saline and warmed to 37°C in a Chronolog whole blood aggregometer. Simultaneously, the impedance electrode is warmed in saline to 37°C. The blood sample with a stir bar is placed in the heating block well, the impedance electrode is placed in the blood sample and the collection software is started. The  
35                    software is allowed to run until the baseline is stabilized and then a 20 Ω calibration check is performed. 20 Ω is equal to 4 blocks on the graphic

produced by the computer software. The agonist (haTRAP) is added by an adjustable volume pipette (5-25  $\mu$ l) and the aggregation curve is recorded for 10 minutes. Maximum aggregation in 6 minutes following agonist is the value recorded.

5 *In vitro* Platelet Aggregation Procedure:

Platelet aggregation studies were performed according to the method of Bednar *et al.* (Bednar, B., Condra, C., Gould, R.J., and Connolly, T.M., Throm. Res., 77:453-463 (1995)). Blood was obtained from healthy human subjects who were aspirin free for at least 7 days by  
10 venipuncture using ACD as anticoagulant. Platelet rich plasma was prepared by centrifugation at 100Xg for 15 minutes at 15 deg C. Platelets were pelleted at 3000xg and washed twice in buffered saline containing 1 mM EGTA and 20  $\mu$ g/ml apyrase to inhibit aggregation. Aggregation was performed at room temperature in buffered saline  
15 supplemented with 0.2 mg/ml human fibrinogen. Test compound and platelets were preincubated in 96-well flat-bottom plates for 60 minutes. Aggregation was initiated by adding 0.3  $\mu$ M haTRAP or 0.1 U/ml thrombin and rapidly vortexing the mixture using a Lab Line Titer Plate Shaker (speed 7). Percent aggregation was monitored as increasing  
20 light transmittance at 405 nm in a Spectromax Plate Reader.

*In vivo* Antitumor Procedure:

Tests in the human breast carcinoma model in nude mouse are conducted according to the procedure reported in S. Even-Ram *et. al.*, Nature Medicine, 4, 8 (1998), p. 909-914.

25 Using the test procedures described above, in the *in vitro* thrombin receptor antagonist assay, compounds of the invention were found to have IC<sub>50</sub> values (i.e., the concentration at which a 50% inhibition of thrombin receptor was observed) in the range of about 4 to 2000 nM, with preferred compounds having IC<sub>50</sub> values in the range of  
30 about 4 to 100 nM.

In the *in vitro* Platelet Aggregation Inhibition (PAI) assay, compounds tested were found to have IC<sub>50</sub> values in the range of 67 to 1000 nM. In the *ex-vivo* C. Monkey Whole Blood PAI, one compound tested showed 100% aggregation at 3 mpk (oral in betahydroxypropyl-  
35 cyclodextrin as cosolvent) and another showed 100% aggregation at 10 mpk (i.v. infusion over 30 min. in 5% dextrose).

# INTERNATIONAL SEARCH REPORT

International application No.

PCT/US 98/ 24523

## Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.: 13,14  
because they relate to subject matter not required to be searched by this Authority, namely:  
Remark: Although claims 13.14  
are directed to a method of treatment of the human/animal  
body, the search has been carried out and based on the alleged  
effects of the compound/composition.
2. ☐ Claims Nos.:  
because they relate to parts of the International Application that do not comply with the prescribed requirements to such  
an extent that no meaningful international Search can be carried out, specifically:
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all  
searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment  
of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report  
covers only those claims for which fees were paid, specifically claims Nos
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is  
restricted to the invention first mentioned in the claims; it is covered by claims Nos

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
